# Voir un site en développement dissimulé par relation domaine/IP sur Windows

#### Ouvrir un Notepad en tant qu'administrateur

#### **Autoriser**

## Ouvrir le répertoire C:\Windows\System32\drivers\etc et sélectionner tous les fichiers comme type de fichier

https://wiki.kajoom.ca/ Printed on 2025/11/23 09:45

#### Sélectionner le fichier hosts

Enter l'adresse IP (p.e. 68.168.124.162) suivi d'une tabulation ou d'espace et le nom de domaine (p.e. test.unsite.com)

```
hosts - Bloc-notes
                                                                                                                                                                            - - X
Fichier Edition Format Affichage ?
# Copyright (c) 1993-2009 Microsoft Corp.
# This is a sample HOSTS file used by Mic
   This is a sample HOSTS file used by Microsoft TCP/IP for Windows.
  This file contains the mappings of IP addresses to host names. Each entry should be kept on an individual line. The IP address should be placed in the first column followed by the corresponding host name. The IP address and the host name should be separated by at least one
   space.
   Additionally, comments (such as these) may be inserted on individual lines or following the machine name denoted by a '#' symbol.
   For example:
            102.54.94.97
38.25.63.10
                                         rhino.acme.com
                                                                                   # source server
                                                                                   # x client host
   localhost name resolution is handled within DNS itself.
127.0.0.1 localhost
                                          localhost
              ::1
68.168.124.162
                                         test.unsite.com
```

#### Sauvegarder le fichier et tester
